Low-Code/No-Code

Why Should Your Business Care?

Agenda

- ❖ Market Demand
- ❖ What LC/NC is.
- ❖ LC/NC vs Traditional Coding
- ❖ Low-Code vs No-Code
- ❖ The Benefits.
- ❖ The Disadvantages
- ❖ The Use Cases
- ❖ The Industries
- ❖ The Revenue
- ❖ The Vendors
- ❖ The Ratings

Market Demand

- ❖ Microsoft expects 500 million new apps to be built in by 2025.
 - Shortage of skilled software developers
- ❖ Gartner forecasting 65% of app development to be low code by 2025.

Low-Code What It Is?

- ❖ **Low-Code** – Appeals to developers and helps them build applications without the help of too much coding. So, it requires a certain level of expertise in programming
- ❖ **Low-Code Platform** - A low-code development platform uses visual interfaces with simple logic and drag-and-drop features instead of extensive coding languages

No-Code What it is?

- ❖ **No-Code** – Appeals to business users that don't want to focus on technical aspects but rather improve their user experience. It is used for businesspeople

Traditional Coding vs Low/No Coding

- ✓ Offered various tools and multiple functions to create highly complex applications so it requires highly technical and sophisticated skills

- ✓ Due to the nature of high technicalities and over complex that tends to produce a lot of bugs and cause hassle to app users.

- ✓ Custom-made software is quite expensive to build and maintain

- ✓ Less agile because of complex codes that requires a lot of time to learn and operate accurately.

- ✓ Traditional platforms need in-house or third-party development team

- ✓ Offered a small set of tools/functions to create various kinds of applications without much hassle so it requires no/low mastery of skills

- ✓ Helped to build bug-free apps that leads to smooth running and hassle-free apps.

- ✓ Much cheaper as needed service is paid to access not developing and maintaining

- ✓ More agile because of less/no code to write for developing apps, instead using drag/drop features and drawing method to do the same.

- ✓ Low-code platforms are managed and run by company that owns the platform.

No-Code vs Low-Code

- ✓ No-coding is required, tools are generally pre-configured
 - ✓ Anyone can use them, from HR to marketing as “citizen developers”
 - ✓ Very little training is required
 - ✓ Minimal customization is possible
 - ✓ They make use of pre-built templates
 - ✓ Used for simple apps
 - ✓ Usually have one use case or fit for purpose
- ✓ Coding is required for specific cases.
 - ✓ Requires skilled developers or technical knowledge.
 - ✓ Training and certification are needed, even some platforms are easy to learn.
 - ✓ Very flexible in terms of customization.
 - ✓ Extendable platform capabilities using pre-built connectors .
 - ✓ Provide end-to-end development.
 - ✓ Multiple use-cases and possibilities – low-code developers can develop nearly everything traditional programmers can.

The Benefits

The Disadvantages

- ❖ **Security** - Lack of knowing underlying code works, how it's written and whether the code is compromised. This means it can be difficult to ensure that low-code apps are developed according to strict security standards. They may also be more difficult to audit so it can pose security and compliance risks for the business.
- ❖ **Vendor lock-in** – Generate convoluted or poorly documented -- even undocumented -- code that is difficult to maintain outside of the platform. In extreme cases, the code might even be inaccessible outside of the specific platform. Evaluate the ability to export, access and edit code using other vendors' editors and software development tools.
- ❖ **Performance.** Low-code apps are unlikely to deliver the highest degree of performance. If you want top performance you may need to optimize every line of code, and for this you'll need a traditional development approach.
- ❖ **Maintainability.** If the low-code tools used to develop an app are discontinued by their vendor, maintenance over the long-term becomes a challenge.

The Use Cases

Web portals

Line of business

Digitized business processes

Internal tools

Field Force applications

Mobile applications

Microservice applications

IoT-based applications

Online databases

The Sample Industries

INDUSTRY	REQUIREMENTS	HOW LOW-CODE HELPS
Education 	■ Address fluctuating enrollments, evolving educational strategies and assessments, and hybrid and remote learning	■ Build and rebuild applications that measure learning outcomes as variables change ■ Integrate various digital platforms, such as enrollment management platforms and learning management systems ■ Help schools manage reopening amid the pandemic, e.g., template-based websites for COVID-19 information
Healthcare 	■ Make data more accessible to patients on more platforms ■ Adhere to stringent security requirements	■ Allow developers to build customer-facing apps that integrate with enterprise systems on the back end so that patients can access information more easily ■ Simplify compliance requirements by generating code that is designed to conform with frameworks like HIPAA out-of-the-box
Financial services 	■ Allow customers to easily monitor financial accounts and data ■ User-friendly interfaces must work across devices and platforms (PC, mobile and web)	■ Developers use low-code to build integrations and UIs that tie into complex or legacy back-end systems ■ Updating limited-functionality customer apps is easier than updating extensive back-end systems
Retail 	■ Adapt to an increasingly digital world with apps that serve customers and also manage back-end operations	■ Develop and deploy apps for order processing, inventory and online order fulfillment ■ Avoid dedicating or hiring a large team of developers to build apps using traditional methods ■ Low-code tools in BPM platforms can help retailers build the software they need at a lower cost

The Revenue

THE GLOBAL MARKET REVENUE FORECAST FOR LOW CODE PLATFORMS (2020-2026)

Average Forecasted Growth of Global Low-Code/No-Code Market (US\$ billion)

The Revenue

(in Million \$)	2019	2020	2021
Low-Code Application Platforms (LCAP)	3,473.5	4,448.2	5,751.6
Intelligent Business Process Management Suites (iBPMS)	2,509.7	2,694.9	2,891.6
Multiexperience Development Platforms (MDXP)	1,583.5	1,931.0	2,326.9
Robotic Process Automation (RPA)	1,184.5	1,686.0	2,187.4
Citizen Automation and Development Platform (CADP)	341.8	438.7	579.5
Other Low-Code Development (LCD) Technologies*	59.6	73.4	87.3
Overall	9,152.6	11,272.2	13,824.2

** Other LCD technologies include rapid mobile app development (RMAD) tools and rapid application development (RAD) tools. Low-code is the evolution of RAD to cloud and SaaS models.*
