Objectives

- Learn neural network architectures and apply them for regression and classification tasks using TensorFlow.

1. Introduction to Neural Network Architecture

- Neural networks are computing systems inspired by the biological neural networks that constitute animal brains.
- It consists of interconnected groups of artificial neurons.
- It recognizes patterns, make decisions, and predict outcomes.

1. Introduction to Neural Network Architecture

- Key Components of Neural Networks
 - Layers:
 - Input Layer: Takes in the data.
 - Hidden Layers: Process the data through weights and activation functions.
 - Output Layer: Produces the final result.
 - Neurons: Basic units that process inputs and produce outputs.
 - Weights and Biases: Parameters that the model learns during training.
 - Activation Functions: Introduce non-linearity to the model.

1. Introduction to Neural Network Architecture

■ Layers:

- Input Layer: Takes in the data.
- Hidden Layers: Process the data through weights and activation functions.
- Output Layer: Produces the final result.

1. Introduction to Neural Network Architecture

■ Neurons:

- Receive inputs, apply weights, sum them up, add a bias, and pass through an activation function.

1. Introduction to Neural Network Architecture

■ Activation Functions

Sigmoid

$$\sigma(x) = \frac{1}{1+e^{-x}}$$

tanh

$$\tanh(x)$$

ReLU

$$\max(0, x)$$

Leaky ReLU

$$\max(0.1x, x)$$

Maxout

$$\max(w_1^T x + b_1, w_2^T x + b_2)$$

ELU

$$\begin{cases} x & x \geq 0 \\ \alpha(e^x - 1) & x < 0 \end{cases}$$

2. Feed Forward Neural Networks

- Feed Forward Neural Networks
 - A type of artificial neural network where connections between the nodes do not form a cycle.
 - Data flows in one direction, from input to output

2. Feed Forward Neural Network - Structure

■ Feed Forward Neural Networks

■ Layers:

- Input Layer: Neurons that take the input features.
- Hidden Layers: One or more layers of neurons that apply transformations.
- Output Layer: Neurons that produce the final output.

■ Neurons: Basic units that perform computations.

■ Weights: Parameters that transform the input data within the neurons.

■ Biases: Additional parameters in neurons to adjust the output.

2. Feed Forward Neural Networks

- Feed Forward Neural Networks
 - Forward Propagation
 - Definition: Process of moving inputs through the network to

2. Feed Forward Neural Networks

- Feed Forward Neural Networks

- Backpropagation

Compute a gradient descent with respect to weights.

Comparing outputs to desired system outputs.

Adjust connection weights to narrow the difference between the two.
